This book is great. I have go through and so i am confident that i will going to read through once again again in the future. I am just easily can get a satisfaction of looking at a written book.

On the horizontal plane the accelerating force is $jo, ---fg---0,03. 32,2 = 0,966$ feet j hence, the 243. Rolling motion.--When a carriage rolls down an inclined plane, the friction of the axle chiefly acts in opposition to the accelerating force; if r be the radius of the axle, and a that of the wheel, the friction will amount to $--N--G \cos. a$, and hence a the accelerating force $p=(\sin.a----\cos.a) G$. If a round body AB , a cylinder or sphere, for example, roll Fig. 299. down an inclined plane FH , Fig. 299, we have to consider a progressive and a rotatory motion at the same time. Generally the acceleration of the progression is equal to that of the rotation (156); since if we put the moment of inertia of the rolling body $= G y$, and the radius of the cylinder $=o$, we shall then obtain for the force $AK=K$, with which the cylinder is set into revolution by virtue of the penetration of its Gv parts into those of the inclined plane: $K=p,----$. But the force $r r g a K$ acts opposed to the force for descent $G \sin. a$, hence it follows that the moving force for progressive motion $= G \sin. a--K, . G \sin. a--K$ and the accelerating force...
